                                                                                                                                                                                                                                                                               Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel P-PII genes capable of regulating plant nitrogen assimilation, useful for transgenic plant production, and as probes for isolating additional genomic clones having P-PII gene promoters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is encoded by a nitrogen regulatory PII gene. plant PII (also called P-PII) nucleotide sequences have been isolat They are useful for regulating nitrogen assimilation in plants, and transgenic plant production. They are also used to engineer organis that overexpress wild-type or mutant P-PII regulatory proteins. P-P proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic with the promoters of P-PII genes. P-PII promoters are light- and/o sucrose-inducible, and are suitable for genetic engineering of plan
transgenic plant production. They are also used to engineer organis that overexpress wild-type or mutant P-PII regulatory proteins. P-P proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic with the promoters of P-PII genes. P-PII promoters are light- and/o sucrose-inducible, and are suitable for genetic engineering of plan

These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                62

                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated Acinetobacter baumannii nucleic acids The A. baumannii rucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         VEALLRPWRVSQVSSALLKIGIRGVTVSDVRGFGAQGGSTERQGGSEFSEDKFVAKVKME

regulatory PII gene. Novel suces have been isolated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is encoded by a nitrogen regulatory PII gene. Nove plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clor with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3 KVBAILRPWRVSQVSSALLKIGIRGVTVSDVRGFGAQGGSTERQGGSEFSEDKFVAKVKM

The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                           forensic;
                                                                                                                                                                                                                         1; chromosome mapping; gene mapping; gene therapy; forensisupplement; medical imaging; diagnostic; genetic disorder

supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Noter the convertion of the convertion of the convertion of the convertion of the convertion.

AAF71138 to AAF71357 encode the Corynebacterium glutamicum homeostasis and adaptation (HA) proteins given in AAB79023 to AAB79242. The C. glutamicum HA genes (I) can be used in vectors for expression in host cells and production of fine chemicals, such as, an organic acid, cells and production of fine chemicals, such as, an organic acid, proteinogenic or nonproteinogenic amino acid (preferred), purine or pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated fatty acid, diol, carbohydrate, aromatic compound, vitamin, cofactor, collyketide or enzyme. The amino acids produced can be lysine, glutamine, collyketide or enzyme. The amino acids produced can be lysine, glutamine, cysteine, valine, leucine, isoleucine, serine, threonine, methionine, tyrosine, phenylalanine, or tryptophan. The fine chemical production can be modulated. The presence of (I) or HA proteins encoded by then are used for glutamicum genome or can be used as markers for genetically engineered Corynebacterium or Brevibacterium. The HA proteins encoded by the (I) are used to maintain homeostasis in C. glutamicum or help the microorganism to adapt to different environmental

The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                  New nucleotide sequence useful in the identification or Lactococcus lactis and related species.
                                                                                                                              Ehrlich SD;

Nature 404, 502-506, 2000
A;Title: Complete DNA sequence of a serogroup A strain of Neisseria menigitidis ; A;Steference number: A81775; MUID:2022556; PMID:10761919
A;Accession: H81961
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-112 <PAR>
A;Cross-references: GB:AL162753; GB:AL157959; NID:g7379120; PIDN:CAB83744.1; PID:C;Genetics:

Tandeau de Marsac N.;
Submitted (APR-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GS
-!- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF NR-I TO
GENB (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I
NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN P-II
IS PHOSPHORYLATED, THESE EVENTS ARE REVERSED (BY SIMILARITY).
-!- FUNCTION: IN NITROGEN-LIMITING CONDITIONS, WHEN THE RATIO OF GLN
TO 2-KETOGLUTARATE DECREASES, P-II IS PHOSPHORYLATED WHICH ALLOWS
THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE (GS), THUS ACTIVATING
THE ENZYME (BY SIMILARITY).

II. Sequence determination of the entire genome and assignment of potential protein-coding regions."; DNA Res. 3:109-136[1996].

-!- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GS GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I TO SHOSPHORYLATED, THESE EVENTS ARE REVERSED (BY SIMILARITY).

-!- FUNCTION: IN NITROGEN-LIMITING CONDITIONS, WHEN THE RATIO OF GLN TO 2-KETOGLUTARATE DECREASES, P-II IS PHOSPHORYLATED WHICH ALLOWS THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE (GS), THUS ACTIVATING THE ENZYME (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          There are no restrictions on ig as its content is in no

       EVENTS ARE REVERSED. WHEN THE RATIO OF GLN TO 2-KETOGLUTY DECREASES, P-II IS URIDYLYLATED TO P-II-UMP, WHICH CAUSES DEADENYLYLATION OF GLUTAMINE SYNTHETASE BY GLNE, SO ACTIVENZYME (BY SIMILARITY).

SUBUNIT: Homotrimer (By similarity).

PTM: Uridylylated/deuridylylated by glnD (By similarity)

SIMILARITY: Belongs to the P(II) protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sp7

   TO 2-KETOGLUTARATE DECREASES, P-II IS URIDYLYLATED TO P-II-UMP.
P-II-UMP ALLOWS THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE (GS THUS ACTIVATING THE ENZYME. CONVERSERLY, IN NITROGEN EXCESS P-I IS DEURIDYLATED AND PROMOTES THE ADENYLATION OF GS.
FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GS GENE {GLNA}. P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN P-I IS URIDYLYLATED TO P-II-UMP, THESE EVENTS ARE REVERSED.
SUBBUNIT: Homotrimer (By similarity).
SIMILARITY: Belongs to the P(II) protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GLUTAMINE SYNTHETASE GENE (GLNA). TO 2-KETOGLUTARATE DECREASES, P-II IS URIDYLYLATED TO P-II-UME
P-II-UMP ALLOWS THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE (
THUS ACTIVATING THE ENZYME. CONVERSERLY, IN NITROGEN EXCESS P-
IS DEURIDYLATED AND PROMOTES THE ADENYLATION OF GS.
FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE G
GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I
NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN P-
IS URIDYLYLATED TO P-II-UMP, THESE EVENTS ARE REVERSED.
SUBUNIT: HOMOLrimer (By similarity).
SIMILARITY: Belongs to the P(II) protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gammaproteobacteria; Enterobacteriales;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     112
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              111

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
